## DETAILED ACTION

### EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Francis I. Gray (Reg. No. 27,788) on May 26, 2005.

The application has been amended as follows:

- Claim 12 has been replaced with the following:

Claim 12. A method of adjusting a fiber pigtailed assembly for coupling light along an optical axis from a beveled end of an optical fiber to an optical detector having a detector surface tilted and rotated with respect to the beveled end to produce low back reflectance and minimum polarization-dependent responsivity comprising the steps of:

providing a source of light having a plurality of polarization states to the optical fiber  
wherein the light from the optical fiber directly impinges onto the detector surface;

adjusting a rotation angle about the optical axis between the beveled end of the optical fiber and the detector surface of the optical detector adjacent the beveled end while observing an electrical output from the optical detector for a minimum peak-to-peak value indicative of low back reflectance and minimum polarization-dependent responsivity.

*Allowable Subject Matter*

2. Claims 12 & 13 are allowed over prior art of record.

The following is a statement of reasons for the indication of allowable subject matter:

Regarding claim 12, the prior art fails to disclose or make obvious “providing a source of light having a plurality of polarization states to the optical fiber wherein the light from the optical fiber directly impinges onto the detector surface” and in combination with the other recited limitations of claim 12. Claim 13 is allowed by virtue of dependency on the allowed claim 12.

The prior art relied upon in the final rejection Jiang in view of He discloses tilting a detector surface with respect to the beveled end of an optical fiber, and further teaches rotating a fiber and/or detector surface about an optical axis (He, Fig. 7, [0083]), but does so by coupling light from the fiber through a lens and then onto the detector surface, therefore not reading on applicant’s claimed limitation “wherein the light from the optical fiber directly impinges onto the detector surface”.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled “Comments on Statement of Reasons for Allowance.”
